@Face-Font v 1.0.1

@font-face is used to display any type of font on any kind of browsers with no worries.

With this extension you will upload the fonts to your server and you do not relay on any webserver etc.

This extension is quite easy to use and straight forward but there are small tricks that you need to pay attention to avoid issues:

1- You need to have @font-face kit to be able to use this extension.
Each @font-face kit comes with:
TrueType Fonts for Firefox 3.5+ , Opera 10+, Safari 3.1+, Chrome 4.0.249.4+
EOT fonts for Internet Explorer 4+
WOFF fonts for Firefox 3.6+, Internet Explorer 9+, Chrome 5+
SVG fonts for iPad and iPhone

You can download to generate the @font-face kit from many websites for free. e.g:
http://www.fontsquirrel.com/fontface
http://fontface.codeandmore.com/

After Download this is what I have and the red square shows the font files that I do need:

Name	Date modified	Type	Size
demo.html	11/06/2012 19:43	HTML Document	2 KB
NosiferCaps-webfont.eot	11/06/2012 19:43	EOT File	57 KB
NosiferCaps-webfont.svg	11/06/2012 19:43	SVG Document	143 KB
NosiferCaps-webfont.ttf	11/06/2012 19:43	TrueType font file	56 KB
NosiferCaps-webfont.woff	11/06/2012 19:43	WOFF File	31 KB
SIL OFL Font License Nosifer.txt	11/06/2012 19:43	Text Document	5 KB
stylesheet.css	11/06/2012 19:43	Cascading Style S...	1 KB

2- Add the extension to your project and go to Properties by double clicking on the extension.
3- In the section "Family Font Name, edit it to your actual font files name. e.g. here my font files are:
NosiferCaps- webfont.eot
NosiferCaps- webfont.svg
NosiferCaps- webfont.ttf
NosiferCaps- webfont.woff

And my Family Font Name is **NosiferCaps- webfont**
Basically this could be any name as long as the name of the font files and actual font in extension is identical

@Font-face Properties

Font	
Family Font Name	NosiferCaps-webfont
Font Face Files	
eot Font File	C:\NosiferCaps-webfont.eot
svg Font File	C:\NosiferCaps-webfont.svg
ttf Font File	C:\NosiferCaps-webfont.ttf
woff Font File	C:\NosiferCaps-webfont.woff
Heading	
Heading	This is a Heading

4- Navigate to font files as you see in the screenshot above.

5- The rest is just the matter of editing your heading or paragraph.
Bear in mind that if you do not wish to have Heading or Paragraph, just leaves the content blank.

Trick: Because of the limitation access to resources in the Web Builder, you do not edit a setting as below:

- In your Web Builder go to Tools/Options and highlight HTML and make sure the options are ticked as below:

Options

General
HTML
Files & Folders
Publish & Preview
Miscellaneous

General
- ☑ Include pngfix.htc which allows IE to properly render PNG alpha transparency.
- ☑ Preload images used by javascripts.
- ☐ Generate external CSS style sheets for page specific styles.
- ☑ Generate single CSS style sheet for global styles.
- ☑ Generate external JavaScript file for common code.
- ☐ Include page name in automatically generated ID attributes.
- ☑ Enable HTML encoding (based on the selected character set).
- ☑ Enable URL encoding to prevent web unsafe file names.
- ☑ Use @font-face for non web-safe fonts.
- ☑ Use CSS3 gradients instead of images when possible.

This extension is for free of charge for now and you can download it including Help document from below links:

WB Version 7.X and 8.1
http://www.virtualdesigners.co.uk/projects/wb-extensions/@Font-face-7.x-8.1.zip

WB Version 8.2
http://www.virtualdesigners.co.uk/projects/wb-extensions/@Font-face-8.2.zip

I would be glad to hear any feedback to improve this extension.
